RE: Airflow of AQD #s 18 and 19

Dear Lee:

Per our recent conversation, I would like to clarify the confusion concerning the design airflow of the boilers (AQD #s 18 and 19). After researching the design parameters of the boilers, it has been discovered that the airflow used in previous correspondence to the division was stack test results, not design. The design operating airflow of each of the boilers is 178,000 acfm. This design airflow will be used in all future correspondence to the division.

If you have further questions, feel free to contact me at (307) 872-6571.

Sincerely,

Dolly A. Potter
Environmental Engineer
